

EXPERIMENT 1

- Create a database named as 'MCA', then create a table tailored with the name 'students' with fields studentid, studentname, studentmark and studentmail. Insert 4 records
- Calculate the sum, average, maximum and minimum of the marks. Delete the details of the student whose id is '2'

ANSWER :

```
CREATE DATABASE MCA;
```

```
USE MCA;
```

```
CREATE TABLE students (
```

```
studentid varchar(255),
```

```
studentname varchar(255),
```

```
studentmark varchar(255),
```

```
studentmail varchar(255)
```

```
);
```

```
INSERT INTO students (studentid, studentname, studentmark, studentmail)
```

```
VALUES ('1', 'Ashish L', '47', 'daksh@gmail.com');
```

```
INSERT INTO students (studentid, studentname, studentmark, studentmail)
```

```
VALUES ('2', 'Daksh', '49', 'ashidaksh@gmail.com');
```

```
INSERT INTO students (studentid, studentname, studentmark, studentmail)
```

```
VALUES ('3', 'anu', '48', 'anu@gmail.com');
```

```
INSERT INTO students (studentid, studentname, studentmark, studentmail)
```

```
VALUES ('4', 'Manu', '47', 'manu@gmail.com');
```

```
SELECT SUM(studentmark) FROM students;
```

```
SELECT AVG(studentmark) FROM students;
```

```
SELECT MAX(studentmark) FROM students;
```

```
SELECT MIN(studentmark) FROM students;
```

```
DELETE FROM students WHERE studentid='2';
```

EXPERIMENT 2

- Create a database named as 'BANK' then create a table tailored with the name 'customer' with fields custid, custname, custdeposit, custage, custphone. Insert 4 records
Find the maximum and minimum deposit. Update the name of Customer whose custid is 101.
- Display the details of customer whose deposit is greater than 50000

ANSWER :

```
CREATE DATABASE BANK;
```

```
USE BANK;
```

```
CREATE TABLE customer (
```

```
  custid varchar(255),
```

```
  custname varchar(255),
```

```
  custdeposit varchar(255),
```

```
  custage varchar(255),
```

```
  custphone varchar(255)
```

```
);
```

```
INSERT INTO customer (custid, custname, custdeposit, custage,custphone)
```

```
VALUES ('101', 'Ajay', '20000', '27', '90876543219');
```

```
INSERT INTO customer (custid, custname, custdeposit, custage,custphone)
```

```
VALUES ('102', 'Bijay', '25000', '29', '99876543219');
```

```
INSERT INTO customer (custid, custname, custdeposit, custage,custphone)
```

```
VALUES ('103', 'Jijay', '55000', '31', '97776543219');
```

```
INSERT INTO customer (custid, custname, custdeposit, custage,custphone)
```

```
VALUES ('104', 'Vijay', '75000', '37', '95576543219');
```

```
SELECT MAX(custdeposit) FROM customer;
```

```
SELECT MIN(custdeposit) FROM customer;
```

```
UPDATE customer SET custname = 'Abhijay' WHERE custid= '101';
```

```
SELECT * FROM CUSTOMER WHERE custdeposit>50000;
```

EXPERIMENT 3

- Create a database named as 'BANK' then create a table tailored with the name 'customer' with fields custid, custname, custdeposit, custage, custphone. Insert 4 records
- Find the maximum and minimum deposit. Add new column named as 'custemail' to the table. Display the customer deposit whose age is greater than 50.

ANSWER :

```
CREATE DATABASE BANK;
```

```
USE BANK;
```

```
CREATE TABLE customer (
```

```
custid varchar(255),
```

```
custname varchar(255),
```

```
custdeposit varchar(255),
```

```
custage varchar(255),
```

```
custphone varchar(255)
```

```
);
```

```
INSERT INTO customer (custid, custname, custdeposit, custage,custphone)
```

```
VALUES ('101', 'Ajay', '20000', '27', '90876543219');
```

```
INSERT INTO customer (custid, custname, custdeposit, custage,custphone)
```

```
VALUES ('102', 'Bijay', '25000', '29', '99876543219');
```

```
INSERT INTO customer (custid, custname, custdeposit, custage,custphone)
```

```
VALUES ('103', 'Jijay', '55000', '55', '97776543219');
```

```
INSERT INTO customer (custid, custname, custdeposit, custage,custphone)
```

```
VALUES ('104', 'Vijay', '75000', '37', '95576543219');
```

```
SELECT MAX(custdeposit) FROM customer;
```

```
SELECT MIN(custdeposit) FROM customer;
```

```
ALTER TABLE customer
```

```
ADD custemail varchar(255);
```

```
SELECT * FROM CUSTOMER WHERE custage>50;
```

EXPERIMENT 4

- Create a database named as 'MBA' then create a table tailored with the name 'student' with fields studentid, studentname, studentmark and studentmail. Insert 4 records
- Update the name of the student whose id is 2. Calculate the maximum and minimum mark of students. Delete the records from the table student whose mark is 30

ANSWER :

```
CREATE DATABASE MBA;
```

```
USE MBA;
```

```
CREATE TABLE students (  
  studentid varchar(255),  
  studentname varchar(255),  
  studentmark varchar(255),  
  studentmail varchar(255)  
);
```

```
INSERT INTO students (studentid, studentname, studentmark, studentmail)  
VALUES ('1', 'Ashish L', '47', 'daksh@gmail.com');
```

```
INSERT INTO students (studentid, studentname, studentmark, studentmail)  
VALUES ('2', 'Daksh', '49', 'ashidaksh@gmail.com');
```

```
INSERT INTO students (studentid, studentname, studentmark, studentmail)  
VALUES ('3', 'anu', '30', 'anu@gmail.com');
```

```
INSERT INTO students (studentid, studentname, studentmark, studentmail)  
VALUES ('4', 'Manu', '47', 'manu@gmail.com');
```

```
UPDATE students SET studentname = 'Laji' WHERE studentid= '2';
```

```
SELECT MAX(studentmark) FROM students;
```

```
SELECT MIN(studentmark) FROM students;
```

```
DELETE FROM students WHERE studentmark='30';
```
